

## 6. Development of the Pollution Control Technology with the Disassembly of the Structure

**Shigeru Kameda, Masao Konishi, Hiroaki Shiraishi,  
Masafumi Moteki, Sumio Ookawa, Shinichi Nishida**

Dust and water for washing, etc. arise, when the structure is dismantled. In the disassembly of the established incinerator plant, there is the fear in which the contamination including dioxines arises. However, that it can not easily grasp the pollution status of incinerator plant itself and that it has not established method of processing of the pollutant become a problem of the incineration plant demolition work. Then, authors carried out various basic experiments on "The technology which does not emit the pollutant outside in the disassembly", "The work environment improvement technology", "Processing technology of the generated pollutant", "Pollution status grasp method of the disassembly structure".

**Key words :** dioxin, incinerator plant, disassembly, humin, recycled cement
